

# Deployment instructions.

- Install newest Glassfish 4 (For JAVA EE 7 stack)
- Install MySql server (XAMPP may help)
  - Create MySql Database with name "viralpatel" (without quotes). It is better to create it as UTF-8 collation.

- In Glassfish User Console create a new JDBC Connection Pool

<http://localhost:4848/common/index.jsf>

Follow this steps:

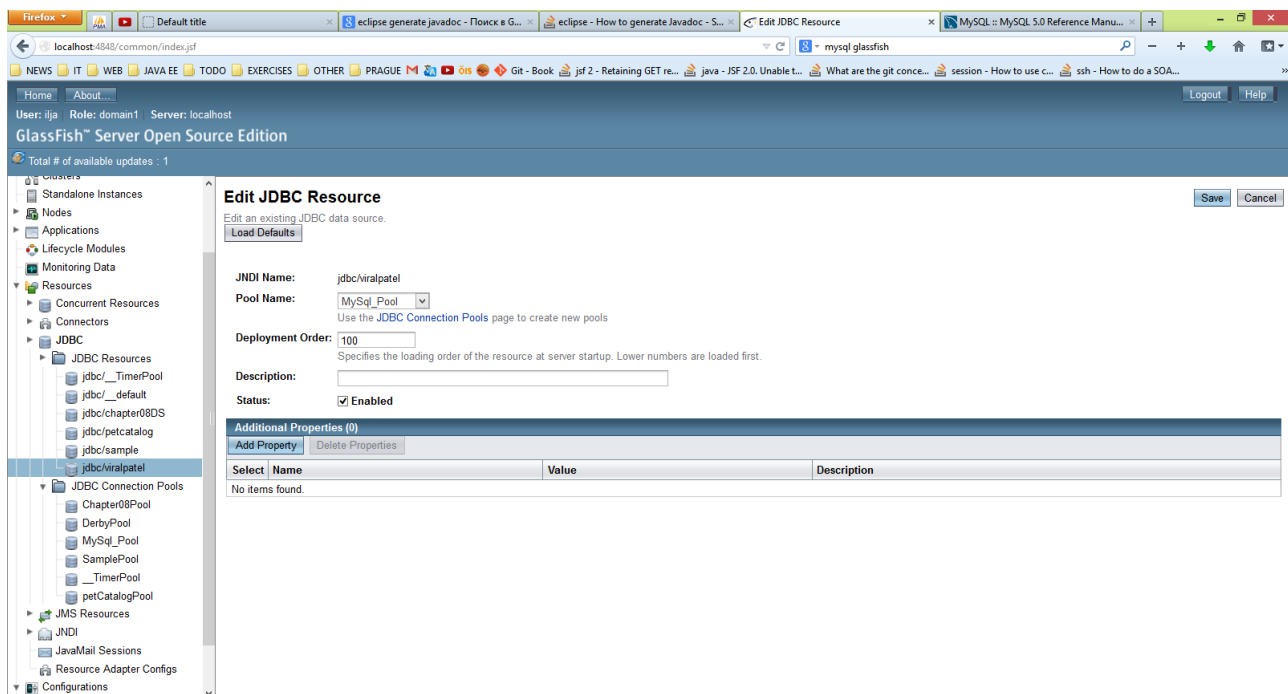

<http://dev.mysql.com/doc/refman/5.0/en/connector-j-usagenotes-glassfish-config.html>

- Create a new JDBC Resource, with following options:

JNDI Name: jdbc/viralpatel

Pool name: your previously created pool in previous step

Mine looks like this:

- copy war file to your glassfish domain autodeploy folder (Mine is C:\glassfish4\glassfish\domains\domain1\autodeploy)
- Restart glassfish. If file was delpoyed then file MusicStore-0.0.1-SNAPSHOT.war\_deployed should appear.
- Open in a browser: <http://localhost:8080/MusicStore/>
